

Kea Webinar

Installation and Configuration

Carsten Strotmann 30th September 2020

https://www.isc.org

Welcome

Welcome to part two of our webinar series
 "the KEA DHCP Server"

About this Webinar

- What is Kea DHCP
- Installation, Platform and Requirements
- Kea Hooks
- Kea basic configuration
- Testing the Kea DHCP server function
- Operating the Kea server
- Kea DHCPv6

What is Kea DHCP?

Kea DHCP (1/2)

- a modern DHCPv4 and DHCPv6 Server
- Open Source (MPL License)
- JSON/REST API
- modular design
- high performance (> 1000 leases/seconds with SQL database backend)
- failover via SQL DB or High-Availability-Hook
- Host reservation support

Kea DHCP (2/2)

- support for DHCPv6 prefix delegation
- dynamic reconfiguration
- dynamic DNS updates
- SQL database backend (MySQL / PostgreSQL / Cassandra ...)
- Statistics module
- PXE Boot support

Platforms and Requirements

Kea Platforms (1/2)

- Kea is officially supported on
 - CentOS Linux
 - Fedora Linux
 - Ubuntu Linux
 - Debian Linux
 - FreeBSD Unix

Kea Platforms (2/2)

- Kea is also know to work on
 - MacOS X
 - Alpine Linux
 - OpenBSD Unix
- Kea currently does not work on Windows operating systems

Kea DHCP requirements

- Kea requires to run
 - a cryptographic library: Botan or OpenSSL
 - log4cplus C++ logging library
 - the Boost C++ system library
- optional components
 - a database such as MySQL, PostgreSQL or Cassandra (CQL)
 - FreeRadius-client library for Radius support
 - Sysrepo for NETCONF support
- see the Kea DHCP documentation for detailed information on software dependencies

Installation

- Kea DHCP is available in the package repositories of all major Linux and Unix systems
 - If you have support from the operating system vendor (Red Hat, Canonical, Suse), installing from the OS repositories is the best choice
- Kea DHCP can also be installed from source, if you need a special build configuration or the latest features not available in the binary packages

- ISC offers binary packages of Kea DHCP for our users and customers, hosted on Cloudsmith.
 - if you need the latest Kea version, these packages are an alternative to building Kea from source
- the packages provide fast access to the latest bug fixes
 - ISC provides the binary packages along with sources at the time of release

Kea binary packages from ISC

- The open source packages contain the base Kea software and the following hooks libraries:
 - Flexible Option
 - Lease Commands
 - High Availability
 - Statistics Commands
 - BOOTP

- Users of Kea that purchase professional Kea DHCP support from ISC are entitled to special software features that are not available in the open source version:
 - Class Commands
 - Configuration Backend Commands
 - Flexible Identifier
 - Forensic Logging
 - Host Cache
 - Host Commands
 - RADIUS support
 - Subnet Commands

Kea hooks

The Kea hooks

- The base Kea software implements the basic DHCPv4 and DHCPv6 functions
- These basic functions can be extended via hooks.
 - The hooks are libraries that contain extra functions that will be called when a DHCP request is processed
 - Hooks allow the core Kea system to stay lean
 - Installations only load the functions used and needed
 - This reduces the complexity and the attack surface of an installation

Types of hooks available

- Hooks that are part of the Kea open source code (source and binary packages)
- Premium hooks that can be purchased online from the ISC website
- Hooks that are available for ISC support subscription customers
- Third party hooks (source code)

Premium/Subscription hooks

- The premium/subscription hooks are available in source and binary (package) form
 - Customers can download the hooks for a period of 12 month
 - As the API between Kea and the hooks might change between Kea versions, care must be taken to install hooks that match the Kea version number

Kea configuration

JSON

- Configuration files for the DHCPv4, DHCPv6, DDNS, Control Agent, and NETCONF modules are defined in an extended JSON format.
- Basic JSON is defined in RFC 7159 and ECMA 404.

```
{
"Dhcp4": {
    "interfaces-config": {
        "interfaces": [ "eth0" ]
    },
    "control-socket": {
        "socket-type": "unix",
        "socket-name": "/tmp/kea-dhcp4.socket"
    },
[...]
```

Extended JSON

- Kea components use an extended JSON with additional features:
 - Shell comments: any text after the hash (#) character is ignored.
 - C comments: any text after double slashes (//) is ignored.
 - Multiline comments: any text between /* and */ is ignored.
 This commenting can span multiple lines.
 - File inclusion: JSON files can include other JSON files by using a statement of the form <?include "file.json"?>.

JSON Editor

- When working with KEA, it helps to have an editor that understands the JSON format, can check the syntax and can highlight and reformat JSON data
 - Emacs
 - VIM
 - Visual Studio Code
 - TextMate / BBEdit

•

EMACS JSON Mode

- EMACS JSON Mode: https://www.emacswiki.org/emacs/JSON
 - Enable JSON-Mode in Emacs with ESC-X json-mode<enter>
 - Re-format a JSON file with CTRL+c-CTRL+f

VIM JSON Syntax Highlighting

 Using VIM, syntax highlighting for JSON can be enabled in the command mode with set syntax=json

- On most Linux/Unix systems, the Kea configuration files can be found under /etc/kea/
 - some have their own locations such as /usr/local/etc/kea on FreeBSD

Kea configuration files

- The main Kea configuration file are
 - kea-ctrl-agent.conf Kea control agent
 - kea-dhcp-ddns.conf Kea dynamic DNS updater
 - kea-dhcp4.conf Kea DHCPv4 server
 - kea-dhcp6.conf Kea DHCPv6 server
 - keactrl.conf configuration file for keactrl script (not in JSON format)

Documentation

- The example configuration files provided by the Kea project contain extensive comments
- The full documentation can be found online at

https://kea.readthedocs.io

A basic Kea DHCPv4 configuration

- The Kea DHCP server needs to know on which network interfaces the DHCP service should listen on
- The control socket defines the communication interface between the DHCP server process and the administration tools

```
{
"Dhcp4": {
    "interfaces-config": {
        "interfaces": [ "eth0" ]
    },
    "control-socket": {
        "socket-type": "unix",
        "socket-name": "/tmp/kea-dhcp4.socket"
    },
[...]
```

Lease database definition

 Kea DHCP needs to know where to store the lease information. The configuration snippet below defines a inmemory database

```
...]
"lease-database": {
    "type": "memfile",
    "lfc-interval": 3600
    },
...]
```

Global configuration and options

 Some DHCP configurations are global and apply to all the subnets and pools managed by the DHCP server

```
[...]
"renew-timer": 900,
"rebind-timer": 1800,
"valid-lifetime": 3600,
[...]
```

IPv4-Subnet and Pool definition

• The example of a [...]

subnet with

DHCP pool

definition

includes subnet

specific options
(default router
option: routers)

Logging

- Kea DHCP has comes with a flexible and powerful logging framework
- The configuration snippet on the right configures a log-file for the DHCPv4 service

Checking the configuration for syntax errors

Kea configuration syntax check

- After changes to a configuration file, and before reloading the new configuration into the Kea server, the configuration file should be checked for errors
 - syntax checks can be done with the -t (test) parameter

Kea configuration check examples (1/2)

 KEA-DHCP4 Syntax Check with error (line 33, char 9)

kea-dhcp4 -t /etc/kea/kea-dhcp4.conf
Syntax check failed with: /etc/kea/kea-dhcp4.conf:33.9: syntax error, unexpected }

Kea configuration check examples (2/2)

Successful Syntax check (output wrapped for readability)

kea-dhcp4 -t /etc/kea/kea-dhcp4.conf

INFO [kea-dhcp4.dhcpsrv/51] DHCPSRV_CFGMGR_ADD_IFACE listening on interface server-eth0

INFO [kea-dhcp4.dhcpsrv/51] DHCPSRV_CFGMGR_SOCKET_TYPE_DEFAULT "dhcp-socket-type" not specified, using default socket type raw

INFO [kea-dhcp4.dhcpsrv/51] DHCPSRV_CFGMGR_NEW_SUBNET4 a new subnet has been added to configuration: 192.0.2.0/24 with params: t1=900, t2=1800, valid-lifetime=3600

Starting, restarting and stopping Kea

keactrl

- keactrl is a shell script that can be used to control the Kea services
- Care must be taken not to conflict with process supervision services such as systemd, runit or s6

keactrl configuration (1/2)

 The configuration for keactrl lists the location of the configuration files and the Kea binaries # This is a configuration file for keactrl script which controls # the startup, shutdown, reconfiguration and gathering the status # of the Kea's processes.

Note that control agent must be launched after servers and netconf last.

prefix holds the location where the Kea is installed. prefix=/usr/local

Location of Kea configuration files.
kea_dhcp4_config_file=\${prefix}/etc/kea/kea-dhcp4.conf
kea_dhcp6_config_file=\${prefix}/etc/kea/kea-dhcp6.conf
kea_dhcp_ddns_config_file=\${prefix}/etc/kea/kea-dhcp-ddns.conf
kea_ctrl_agent_config_file=\${prefix}/etc/kea/kea-ctrl-agent.conf
kea_netconf_config_file=\${prefix}/etc/kea/kea-netconf.conf

Location of Kea binaries.
exec_prefix=\${prefix}
dhcp4_srv=\${exec_prefix}/sbin/kea-dhcp4
dhcp6_srv=\${exec_prefix}/sbin/kea-dhcp6
dhcp_ddns_srv=\${exec_prefix}/sbin/kea-dhcp-ddns
ctrl_agent_srv=\${exec_prefix}/sbin/kea-ctrl-agent
netconf_srv=\${exec_prefix}/sbin/kea-netconf
[...]

keactrl configuration (2/2)

- The last part of the configuration defines which Kea services should be started
 - and controls verbose logging

[...]
Start DHCPv4 server?
dhcp4=yes

Start DHCPv6 server? dhcp6=yes

Start DHCP DDNS server? dhcp_ddns=no

Start Control Agent? ctrl_agent=yes

Start Netconf? netconf=no

Be verbose? kea_verbose=no

start Kea services with keactrl

 After creating a configuration for keactrl, the script can be used to start the Kea server modules

keactrl start

INFO/keactrl: Starting /opt/kea/sbin/kea-dhcp4 -c /opt/kea/etc/kea/kea-dhcp4.conf

INFO/keactrl: Starting /opt/kea/sbin/kea-ctrl-agent -c /opt/kea/etc/kea/kea-ctrl-agent.conf

Kea service status (keactrl)

keactrl offers a status overview of the currently configured modules

keactrl status

DHCPv4 server: active DHCPv6 server: inactive DHCP DDNS: inactive Control Agent: active

Kea DHCPv4 configuration file: /opt/kea/etc/kea/kea-dhcp4.conf Kea DHCPv6 configuration file: /opt/kea/etc/kea/kea-dhcp6.conf

Kea DHCP DDNS configuration file: /opt/kea/etc/kea/kea-dhcp-ddns.conf Kea Control Agent configuration file: /opt/kea/etc/kea/kea-ctrl-agent.conf

keactrl configuration file: /opt/kea/etc/kea/keactrl.conf

 After changing a Kea configuration file (and checking for errors), keactrl can be used to reload the configuration into the Kea processes

keactrl reload

INFO/keactrl: Reloading kea-dhcp4... INFO/keactrl: Reloading kea-ctrl-agent...

 keactrl can also be used to stop all configured Kea modules

keactrl stop

INFO/keactrl: Stopping kea-dhcp4... INFO/keactrl: kea-dhcp6 isn't running. INFO/keactrl: kea-dhcp-ddns isn't running. INFO/keactrl: Stopping kea-ctrl-agent...

start KEA DHCPv4 module via systemd

 On Linux systems, Kea comes with a set of systemd unit files that control the Kea services

systemctl start kea-dhcp4

start KEA DHCPv4 module via systemd

check the status of the Kea DHCPv4 service (Linux systemd)

systemctl status kea-dhcp4

• kea-dhcp4.service - Kea DHCPv4 Server

Loaded: loaded (/usr/lib/systemd/system/kea-dhcp4.service; enabled; vendor preset: disabled)

Active: active (running) since Thu 2018-12-06 10:13:26 UTC; 4s ago

Docs: man:kea-dhcp4(8) Main PID: 63 (kea-dhcp4) Tasks: 1 (limit: 1144) Memory: 1.9M

Testing DHCPv4 with the ISC dhcp client

- Most Linux distributions provide the ISC DHCP client tool dhclient
- This tool can be used as an simple DHCP debugging tool

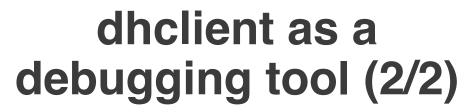

dhclient as a debugging tool (1/2)

 Create a new shell script in /usr/local/sbin/dhclient-debug.sh with the lines below

#!/bin/sh env

- this script will print all variables in it's execution environment
- make the script executeable

Execute the dhclient tool with this script

dhclient -sf /usr/local/sbin/dhclient-debug.sh

- The script will print out all the information received from the DHCP server (via environment variables)
- It will not reconfigure the client machines network stack!

Performance benchmarking: perfdhc

- Kea comes with a DHCP benchmarking tool: perfdhcp
- This tool can be used to benchmark Kea, but also other DHCP server systems
- For details, see the perfdhcp documentation https://kea.readthedocs.io/en/kea-1.6.2/man/perfdhcp.8.html

Kea control agent

Kea control agent

- The Kea control agent is a process that provides a HTTP(s) REST interface
- The control agent can be used to dynamically reconfigure the Kea services (without manually changing the configuration files)
- The kea control agent communicates with the running Kea services via unix control sockets

Configuration of the Kea control agent

- By default, the Kea control agent listens on the (first) IPv4 loopback address 127.0.0.1 Port 8000
- This can be changed in the configuration file kea-ctrl-agent.conf

Kea shell

 The Kea Shell is a Python command line tool to interact with the Kea Control Agent REST API

Kea shell example

- The Kea shell returns the JSON data from the Kea-Modules REST API
 - Tools such as jq can be used to pretty print the output

Reading configuration data

- The REST interface has been designed to be used from a Kea configuration application (such as Kea Stork or Kea Shell)
- However, API calls can be send to the Kea control agent from the command line via the curl tool
- Here we send the config-get command to the DHCPv4 server

```
[kea-server]# curl -X POST -H "Content-Type: application/json" \
-d '{ "command": "config-get", "service": [ "dhcp4" ] }' \
http://127.0.0.1:8000/
```

- The output is unformatted JSON.
 - The tool jq can be used to pretty-print the output

```
[kea-server]# curl -X POST -H "Content-Type: application/json" \
-d '{ "command": "config-get", "service": [ "dhcp4" ] }' \
http://127.0.0.1:8000/ l jq
```

JSON queries with jq

- •jq can be used to filter specific parts of the configuration. The jq filter ".[0].arguments" can be used to produce a valid KEA configuration file.
- The example below prints the logging config of the DHCPv4 server:

[kea-server]# curl -X POST -H "Content-Type: application/json" \
-d '{ "command": "config-get", "service": ["dhcp4"] }' \
http://127.0.0.1:8000/ l jq ".[0].arguments.Dhcp4.loggers"

JSON queries with jq

• Result:

```
{
    "debuglevel": 0,
    "name": "kea-dhcp4",
    "output_options": [
      {
         "output": "/opt/kea/var/log/kea-dhcp4.log"
      }
    ],
    "severity": "INFO"
    }
]
```

List API commands

 The list-commands command returns the API commands available for a specific KEA module

```
[kea-server]# curl -X POST -H "Content-Type: application/json" \
-d '{ "command": "list-commands", "service": [ "dhcp4" ] }' \
http://127.0.0.1:8000/ l jq
```

- With the REST API, it is possible to
 - remotely fetch the current running config of a Kea server
 - change the config
 - and write the config back to the server

Dynamic changes to the Kea configuration file (2/5)

Dump the current configuration into a file

```
curl -s -X POST -H "Content-Type: application/json" \
-d '{ "command": "config-get", "service": [ "dhcp4" ] }' \
http://127.0.0.1:8000/ l jq ".[0]" > kea-dhcp4.tmp
```

- Edit the file
 - Add
 the command and service information
 - Make changes to the configuration
 - Remove the result from the JSON file

Dynamic changes to the Kea configuration file (4/5)

 Send the new configuration to the server

```
[kea-server]# curl -s -X POST -H "Content-Type: application/json" \
    -d @kea-dhcp4.tmp http://127.0.0.1:8000/ l jq
[
    {
        "result": 0,
        "text": "Configuration successful."
    }
]
```

Dynamic changes to the Kea configuration file (5/5)

- All dynamic changes are stored in memory
 - To make the changes persistent, write the in-memory configuration back to a file with the config-write command (be careful, any comments in the file will be gone and the formatting will be different)

Kea DHCPv6 configuration

Kea DHCPv6 configuration

- the Kea DHCPv6 server is independent from the Kea DHCPv4 server
- both can be started together on the same machine, or on separate machines
- the configuration file for the Kea DHCPv6 server is kea-dhcp6.conf
- the Kea DHCPv6 server can be controlled from the keactrl script or through systemd (on Linux)
- the DHCPv6 configuration can be managed through the Kea Control Agent and Kea Shell

Kea DHCPv6 DUID

- each DHCPv6 server has a unique DHCP-Unique-ID (DUID)
- when re-installing a DHCPv6 server, it might be useful to backup and restore the DUID of the system
- the Kea DHCPv6 DUID is stored in the file keadhcp6-serverid in the /var/lib/kea directory (the path is system/distribution dependent)

Next Webinars

- 14th October Kea DHCP Lease allocation, client classification, and option assignment
- 28th October Kea DHCP High Availability and Database Backends
- 18th November Kea DHCP Monitoring, Logging, and Stork
- 2nd December Kea DHCP Migrating to Kea from ISC DHCP

Questions and Answers
